

Healthcare AI QA Engineering Platform

Step 0.2 - Repository Foundation + GitHub Configuration

Objective

Initialize repository foundation and configure GitHub origin safely.

Architecture

Modular structure for frontend, automation, AI components, mock systems, knowledge, and docs.

Repository Structure

- frontend, automation, rag, mcp, agent
- mock-systems/jira, confluence, jenkins
- knowledge/brd, prd, epics, user-stories, acceptance-criteria, business-rules, test-scenarios, test-cases
- docs/architecture, qa, rag, mcp, agent, implementations, .github

Git Configuration

- Local repository initialized
- Branch: main

GitHub Configuration

- origin: <https://github.com/Satishnjr/healthcare-ai-qa-engineering.git>

Security

- No credentials/tokens/passwords stored
- .gitignore covers env files, secrets, logs, and test artifacts

Validation

- Git init, branch, and remote checks: PASS
- Structure and mandatory docs checks: PASS
- Secret pattern scan: PASS (no obvious matches)
- No package installation performed

Git Commit

- 2742800236b4b0054c1267bfc9d5d5c33781d30e
- Message: chore(project): initialize healthcare ai qa foundation

Git Push

- Status: SUCCESS
- Remote verification: SUCCESS (refs/heads/main confirmed)

Lessons Learned

- Foundation-first execution improves reproducibility and governance on constrained enterprise systems.

Interview Talking Points

- Why repository baseline before features
- How to handle enterprise constraints and security without bypassing controls
