

Healthcare AI QA Engineering Platform

Step 0.1 - Environment Discovery (Documentation Correction)

Project Context

Frontend-only healthcare QA/AI platform built incrementally under office-laptop constraints.

Objective

Safely inspect toolchain and repository readiness without installs or system changes.

Environment and Tool Versions

- Git 2.46.0
- Node.js 24.18.0
- npm 11.16.0
- npx 11.16.0
- Python 3.14.6
- pip 26.1.2
- uv 0.11.19
- Java 21.0.8
- Maven 3.9.9
- PowerShell 5.1
- VS Code CLI 1.132.0

Missing Tools

- Docker, pnpm, yarn, Playwright CLI, Cucumber JS CLI, pytest

Repository State

- Current folder was not a Git repository
- No Git remote configured
- Only debug.log existed; no project files were present

Network Constraints

- Codex sandbox network disabled; GitHub connectivity could not be safely verified

Office Laptop Constraints

- No admin privileges assumed
- No system-wide installations
- No security bypass

Risks

- Git workflows blocked until repository initialization in Step 0.2
- Missing optional tools may affect later phases depending on policy

Blockers

- Git not initialized in current folder
- Remote not configured

Recommended Next Step

- Step 0.2 - Repository Foundation

Interview Talking Points

- Discovery-first approach reduces setup risk and improves reproducibility
- Local/project-scoped tooling preferred over global installs in enterprise contexts
