

Healthcare AI QA Engineering Platform

Step 0.2 - Repository Foundation + GitHub Configuration

Objective

Initialize repository foundation and configure GitHub origin safely.

Architecture

Modular structure for frontend, automation, AI components, mock systems, knowledge, and docs.

Repository Structure

- frontend, automation, rag, mcp, agent
- mock-systems/jira, confluence, jenkins
- knowledge/brd, prd, epics, user-stories, acceptance-criteria, business-rules, test-scenarios, test-cases
- docs/architecture, qa, rag, mcp, agent, implementations, .github

Git Configuration

- Repository initialized locally
- Branch set to main

GitHub Configuration

- origin: <https://github.com/Satishnjr/healthcare-ai-qa-engineering.git>

Security

- No credentials/tokens/passwords stored in files
- .gitignore covers env files, secrets, logs, artifacts

Validation

- Git init/branch/remote checks performed
- Structure and mandatory docs created
- No package installation performed

Git Commit

- Pending update after commit execution

Git Push

- Pending update after push execution

Lessons Learned

- Foundation-first execution improves reproducibility and governance.

Interview Talking Points

- Why repository baseline before features
- How to handle enterprise constraints and security
