

Step 1.8 Implementation Report

- Healthcare AI QA Engineering - CareFlow Health
- Document Type: Step Implementation Report
- Status: PASS
- Scope: Test Scenario -> Test Case only

Objective

- Define canonical, detailed, traceable, and automation-ready test cases from approved test scenarios.

Context and Boundaries

- Project remains frontend-only with synthetic healthcare data.
- No backend, API, Playwright, Cucumber, RAG, MCP, LangGraph, or agent implementation was introduced in this step.

Requirements-to-Test Lifecycle

- BRD -> PRD -> Epic -> User Story -> Acceptance Criteria -> Test Scenario -> Test Case
- Traceability document was extended to include scenario-to-test-case mapping.

Design Approach

- Used stable IDs: TC-<SCENARIO-ID>-<SEQUENCE>.
- Preserved scenario intent while making step-level execution explicit.
- Kept expected results UI-observable and deterministic for future automation.

Coverage Results

- Total Test Scenarios: 96
- Total Test Cases: 96
- User Stories Covered: 32
- Acceptance Criteria Covered: 109
- Smoke: 6, Regression: 96
- Priority: P0=16, P1=40, P2=40, P3=0

Classification and Metadata

- Test type, level, priority, risk, module, actor, dependencies, tags, and AI relevance metadata are defined per test case.
- Playwright page-object area and Cucumber scenario reference are included for future implementation.

Automation Readiness

- All test cases are marked automation candidates with prioritized automation lanes.
- Steps and expected outcomes are suitable for Playwright + TypeScript + Cucumber conversion.

AI Readiness

- RAG relevance supports retrieval by IDs, tags, modules, and traceability links.
- MCP relevance supports future test case query and execution-tool operations.
- Agent relevance supports prioritization, regression selection, and failure-impact workflows.

Validation

- Unique IDs verified.
- No orphan test cases.

- No uncovered scenarios.
- No out-of-scope technical implementation introduced.

Interview Q&A Themes

- Scenario vs test case
- Traceability governance
- Risk-based prioritization
- Smoke vs regression strategy
- Automation readiness and AI-QA relevance

Next Step

- Step 1.9 - Test Data & Test Management Strategy
