

Step 1.5 - User Story Definition Implementation Report

Project overview

- Project: Healthcare AI QA Engineering Platform
- Product: CareFlow Health
- Step: 1.5 User Story Definition
- Status: PASS

User Story strategy

- Created canonical user stories from approved epics and PRD requirements.
- Used stable IDs in US-<epic>-<sequence> format.
- Kept all stories business-oriented and acceptance-criteria ready.

Story inventory

- Total Epics: 12
- Total User Stories: 32
- Distribution reflects epic complexity, not fixed per-epic counts.

Epic, BRD, and PRD mapping

- All epics have at least one mapped user story.
- Traceability table added: BRD ID, PRD ID, Epic ID, User Story ID, Requirement, Status.
- All FR requirements are represented in story mappings.

PRD coverage reconciliation

- Total PRD requirements: 44
- Mapped to Epics: 31
- Not directly mapped: 13 (cross-cutting NFR-001 to NFR-013)
- Cross-cutting NFRs are covered via quality expectations across stories.

Story examples

- US-001-001 Login screen rendering
- US-003-003 Patient search by ID/name/DOB/phone
- US-004-001 Appointment creation
- US-006-002 Clinical note simulation save flow
- US-009-002 Loading/empty/error/success state handling

QA, Playwright, and Cucumber relevance

- Each story includes preconditions, main/alternate/negative flow, and validation expectations.
- Future chain documented: Story -> AC -> Gherkin -> Steps -> Page Object -> Playwright test.
- No automation artifacts were implemented in this step.

RAG, MCP, and LangGraph relevance

- Stable IDs and traceability links enable retrieval and explainable requirement analysis.
- Future MCP queries and LangGraph reasoning workflows are documented only.

Jira, Confluence, Jenkins relevance

- Dataset is ready for future Jira story conversion under mapped epics.
- Documentation hierarchy aligns with future Confluence structure.
- Future Jenkins relevance documented for quality/report grouping; no pipeline implementation.

Implementation boundaries

- Frontend: NOT IMPLEMENTED
- Backend/API/API automation: NOT IMPLEMENTED
- RAG/MCP/LangGraph: NOT IMPLEMENTED

Interview talking points

- How story quality enables AC and BDD readiness.
- How traceability prevents orphan requirements.
- How cross-cutting NFRs are handled without artificial epic forcing.
