

## Healthcare AI QA Engineering Platform

### Step 1.1 - Healthcare Product Vision & Requirements Strategy

Product: CareFlow Health

#### Objective

Define product vision and requirements strategy before BRD/PRD authoring.

#### Product Vision

- Frontend-only healthcare management portal simulation for QA/AI engineering.

#### Product Scope

- In-scope and out-of-scope boundaries documented with explicit no-backend/no-API rules.

#### User Roles

- Patient, Doctor, Nurse, Receptionist, Healthcare Administrator roles and capabilities defined.

#### Application Modules

- Planned module catalog established (login, dashboard, patients, appointments, etc.).

#### User Journeys

- 12 role-based journeys documented with preconditions, main/alternate/error flows.

#### Requirements Strategy

- Hierarchy defined from Product Vision through Automation with BRD/PRD staging.

#### QA Strategy

- Frontend-focused QA strategy defined; API testing marked not applicable.

#### AI/RAG Relevance

- Future knowledge and AI-agent usage of requirements artifacts documented.

#### Traceability

- Requirement -> Story -> AC -> Scenario -> Case -> Automation -> Result -> Defect chain defined.

#### Architecture Relationship

- Step 1.1 aligns with Step 0.3 architecture/standards and avoids premature implementation.

#### Interview Talking Points

- Why product strategy before BRD/PRD
- Why frontend-only and synthetic data
- How traceability supports QA and AI workflows

#### Next Steps

- Step 1.2 (BRD authoring) planned; no auto-execution performed.
