

Step 1.4 - Epic Definition Implementation Report

Project Overview

- Project: Healthcare AI QA Engineering Platform
- Product: CareFlow Health
- Scope: Documentation-only epic definition for frontend-only system
- Status: PASS

Epic Strategy

- Created 12 business-meaningful epics from approved PRD requirements.
- Used stable IDs EPIC-001 through EPIC-012 and explicit metadata.
- Avoided technical-task epics and preserved synthetic-data constraints.

Epic Inventory

- EPIC-001 Authentication and Access Simulation
- EPIC-002 Role-Aware Dashboard and Work Visibility
- EPIC-003 Patient Identity and Profile Management
- EPIC-004 Appointment Lifecycle Management
- EPIC-005 Doctor Directory and Schedule Management
- EPIC-006 Medical Records and Clinical Notes Simulation
- EPIC-007 Prescription Review and Medication Visibility
- EPIC-008 Billing and Insurance Information Visibility
- EPIC-009 Notifications and User Feedback Experience
- EPIC-010 Reporting and Operational Insights
- EPIC-011 User Administration and Settings
- EPIC-012 Activity History and Audit Simulation

Business Value

- Epics provide planning-scale capability boundaries for product and QA teams.
- They enable prioritization, ownership clarity, and dependency-aware delivery.
- They create stable parent artifacts for user stories and acceptance criteria.

Traceability

- Added Epic mapping in requirements traceability table:
 - | BRD ID | PRD ID | Epic ID | Requirement | Status |
- Maintained existing BRD->PRD mappings and extended to BRD->PRD->Epic chain.
- Included dedicated epic-to-PRD/BRD table in epic document.

Dependencies

- Primary dependency chain: EPIC-001 -> EPIC-002 -> EPIC-003 -> EPIC-004 -> EPIC-006 -> EPIC-007
- Additional dependencies are documented for dashboard, doctor, reporting, and activity flows.

QA Relevance

- Each epic includes relevance for functional, UI, validation, negative, accessibility, responsive, cross-browser, and regression testing.

Playwright and Cucumber Relevance

- Defined future hierarchy: Epic -> User Story -> Acceptance Criteria -> Gherkin -> Steps -> Page Object -> Playwright Test.
- BDD relevance documented without creating feature files in this step.

RAG, MCP, and LangGraph Relevance

- Epic structure is optimized for retrieval with stable IDs and atomic sections.
- MCP and LangGraph relevance documented as future planned capabilities only.

Jira, Confluence, and Jenkins Relevance

- Epic metadata is designed for future Jira conversion.
- Confluence hierarchy alignment is documented.
- Future Jenkins relation is documented without pipeline implementation.

Interview Talking Points

- Why epics are required between PRD and user stories.
- How traceability avoids orphan requirements.
- How epic structure improves QA and AI-assisted analysis readiness.

Implementation Boundaries

- Frontend implementation: NOT IMPLEMENTED
- Automation implementation: NOT IMPLEMENTED
- RAG implementation: NOT IMPLEMENTED
- MCP implementation: NOT IMPLEMENTED
- Agent implementation: NOT IMPLEMENTED
